

Communtu (<http://en.communtu.org>) is a web2.0 platform, the goal of which is to ease the post-installation of your Ubuntu system.

After specifying what you want to do with your computer, which version of Ubuntu you are using and what your desktop environment (Gnome, KDE or Xfce) is, Communtu suggests to you several programs and the possibility to refine the selection of the soon be installed programs. Communtu now generates a meta-package in the background which can be installed after adding the sources via a click on a button, through the web interface.

Furthermore it is possible to create your own bundle. Either you add the programs you want to install to the bundle editor or you can let your system create a list with all installed programs on your computer and upload that list into the bundle editor to create your own bundle.

A registration is optional. Communtu can be used totally anonymously with a temporary account. This account can be changed into a permanent account by the user if he or she likes Communtu.

Communtu can be used in different ways:

- for an easier post-installation of the system after the first start of the system,
- for an easier installation of the currently installed programs if the system has to be set up again,
- for an easier setup of several computers (even running with different distributions) with the same programs or
- to pass the list of installed programs from one's own computer to friends.

Communtu is totally free of charge, as Ubuntu is. It is a community project and is developed by a small independent team (join us if you are interested).

To obtain further information about Communtu take a look at the web page, e-mail us ([info@communtu.org](mailto:info@communtu.org)) or read the flyer ([http://en.communtu.org/communtu\\_flyer\\_en.pdf](http://en.communtu.org/communtu_flyer_en.pdf)).
